

**Getting the Selective Attention for
Identification model (SAIM) in touch with
the neurophysiological side**

**Dietmar Heinke
School of Psychology
University of Birmingham**

Overview

- **Selective Attention for Identification model (SAIM)**
- **Visual search**
 - Natural images
 - Asymmetry
- **Spiking version**

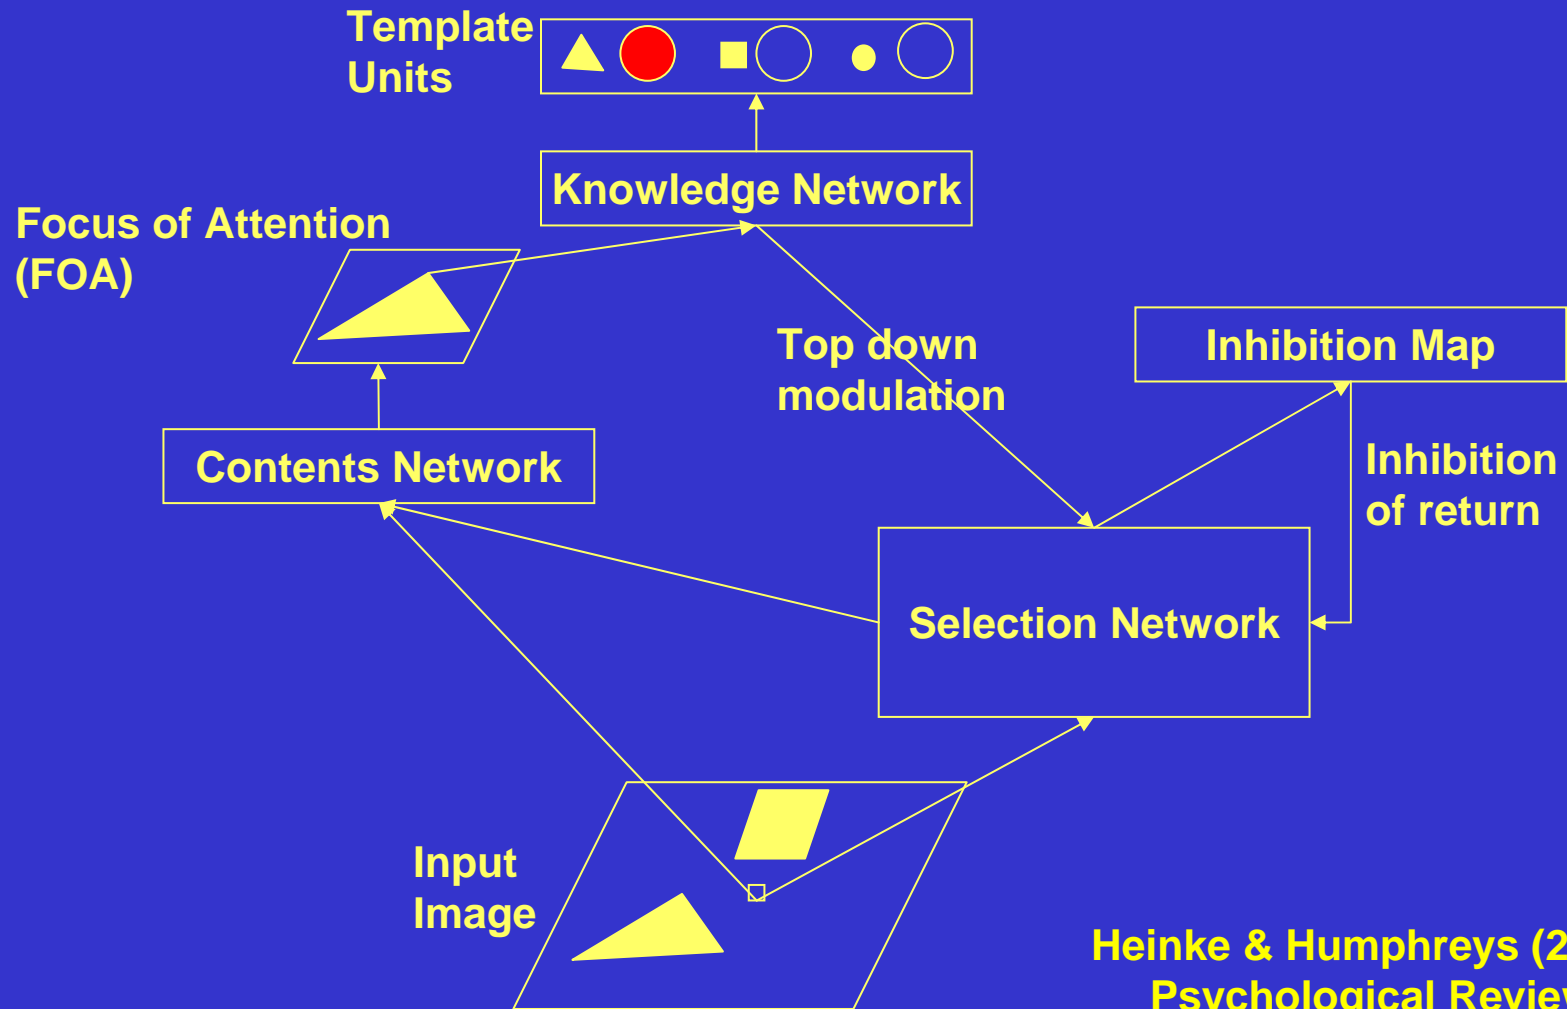

- **Andreas Backhaus**
- **Christoph Boehme**
- **Yuanyuan Zhao**
- **Martin Kreyling**
- **Yarou Sun**
- **Eirini Mavritsaki**

Selective Attention for Identification Model (SAIM)

How do humans identify objects in a scene with multiple objects?

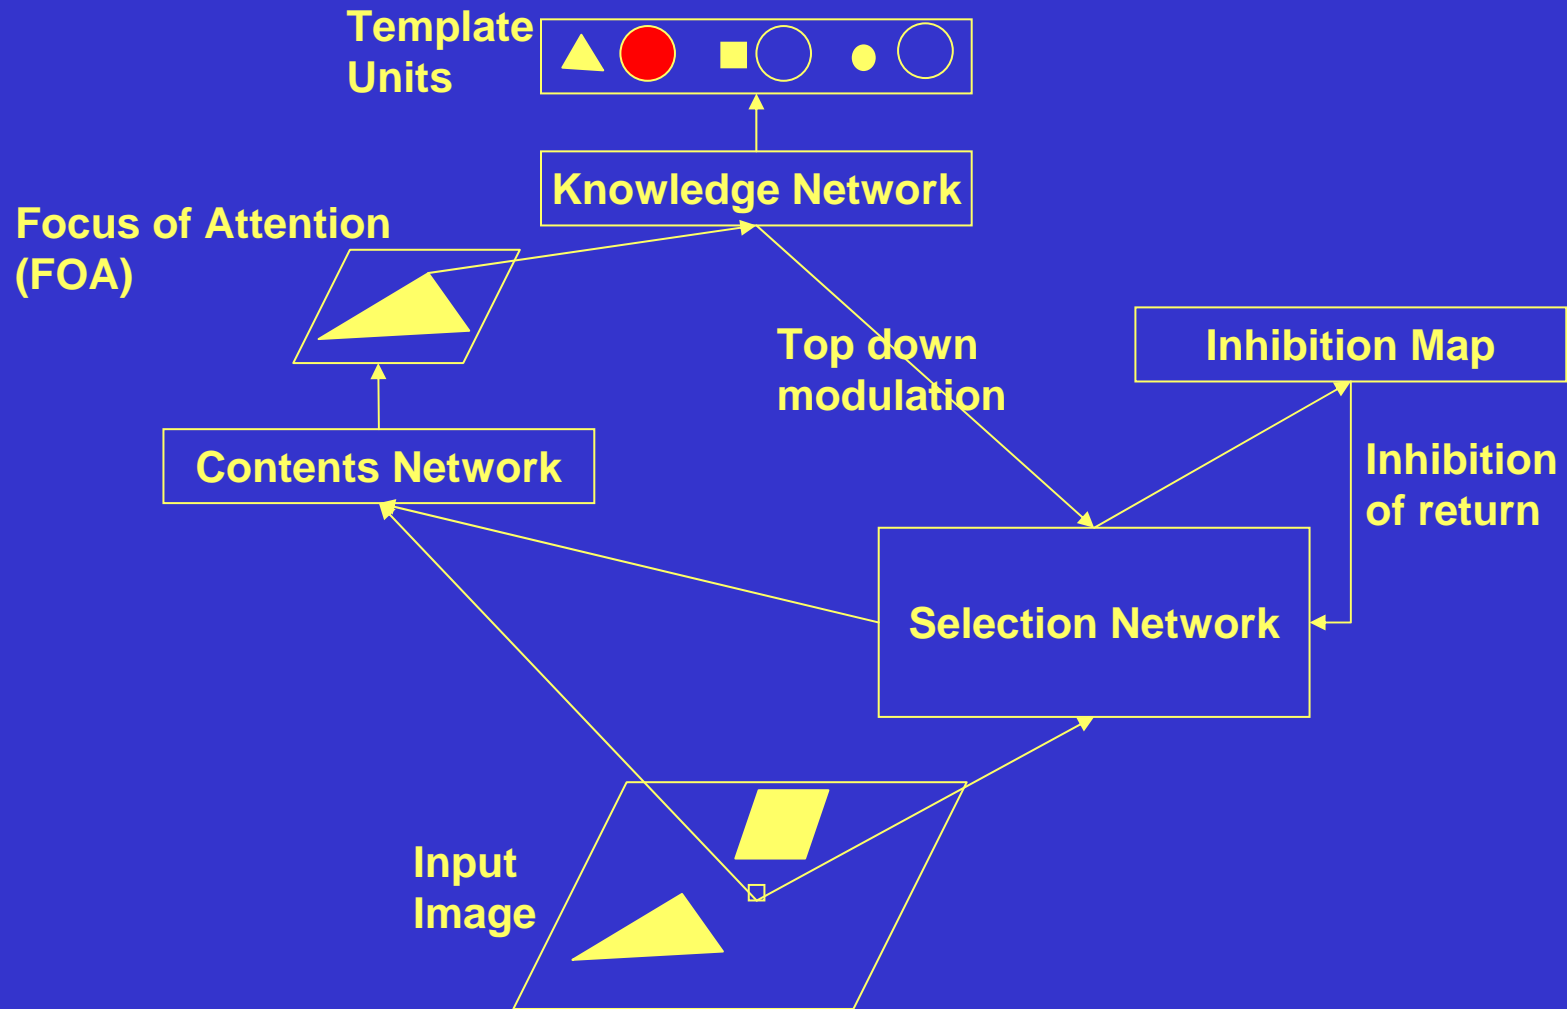

- Translation-invariant object identification
- Spatial selection
- Serial Scan
- Connectionist Framework

Architecture of SAIM

Heinke & Humphreys (2003)
Psychological Review

Architecture of SAIM

Goal: Enabling Translation-invariant Mapping

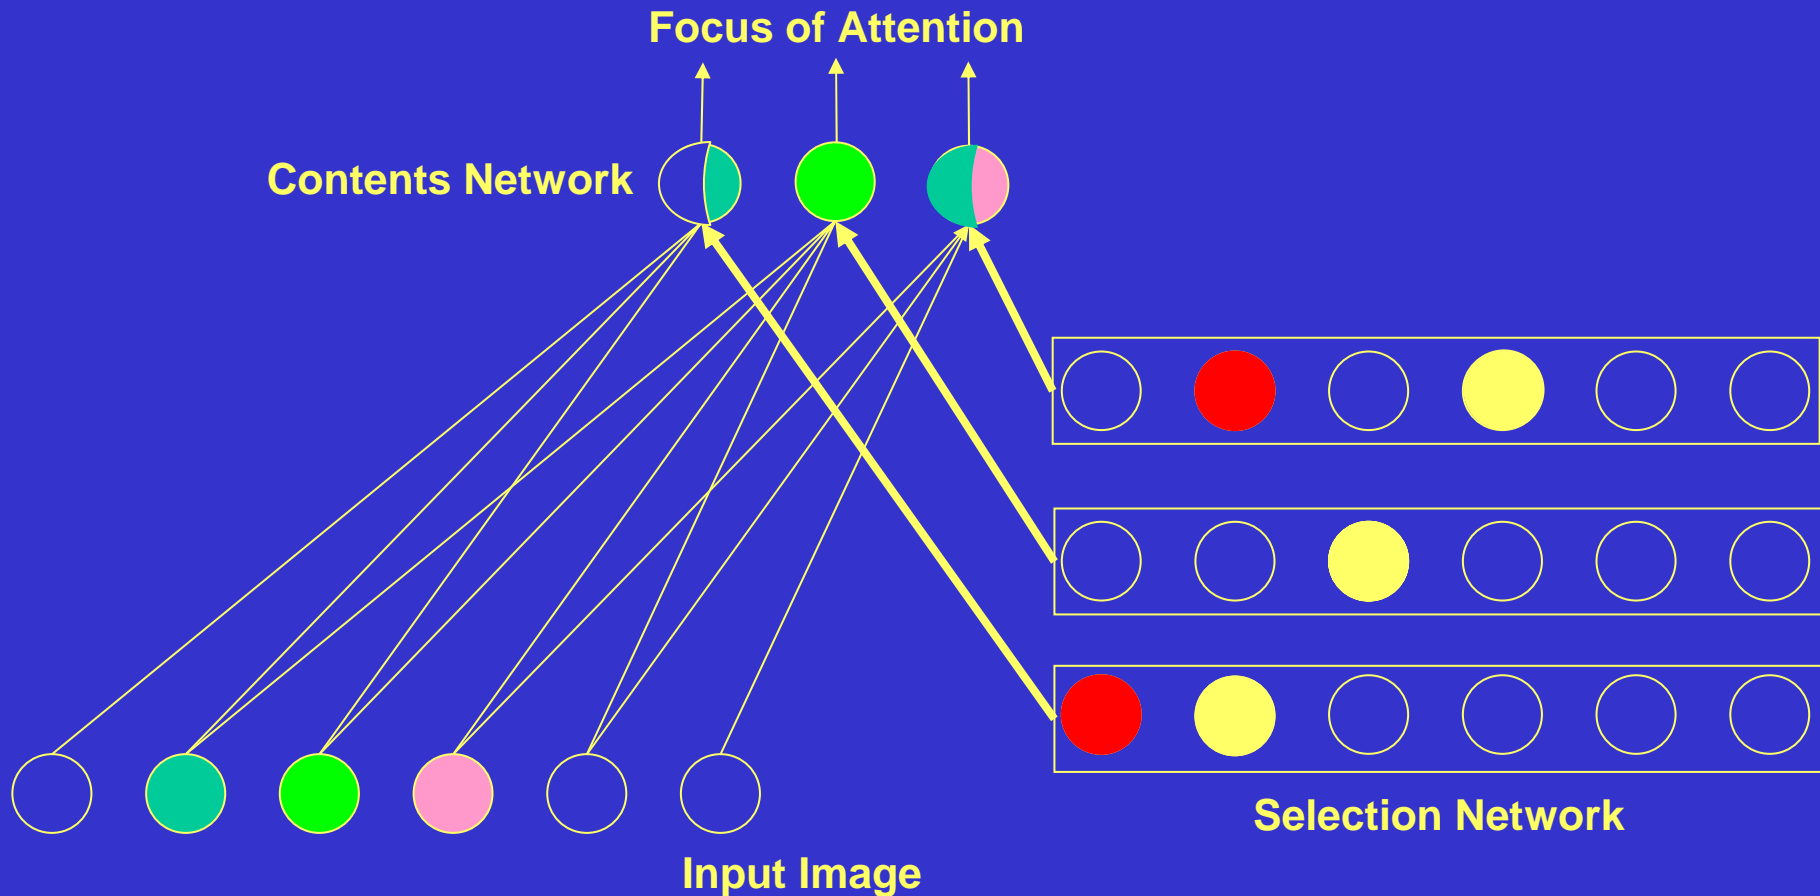

Contents Network

Selection Network

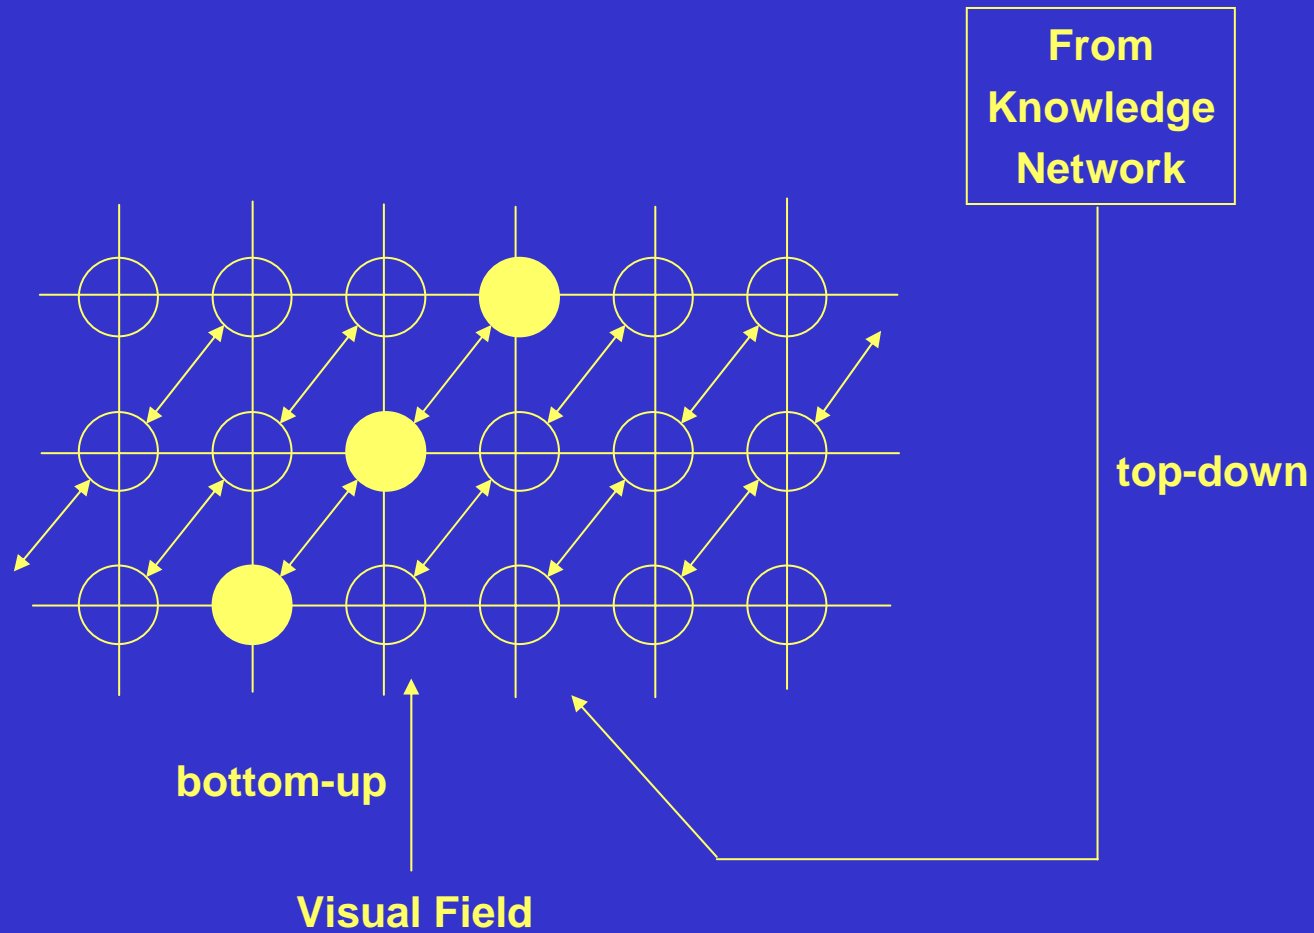

Goal: Correct mapping of contents network

Design of SAIM

- **Constraint satisfaction problem**
- **Construction of energy function (Hopfield & Tank 1985)**
- **Gradient descent**
- **Topology of connections**
- **Competitive and cooperative interactions**

Topology in Selection Network

Knowledge Network

- **Templates**
- **Template matching with scalar product**
- **Winner take all**

Focus of Attention

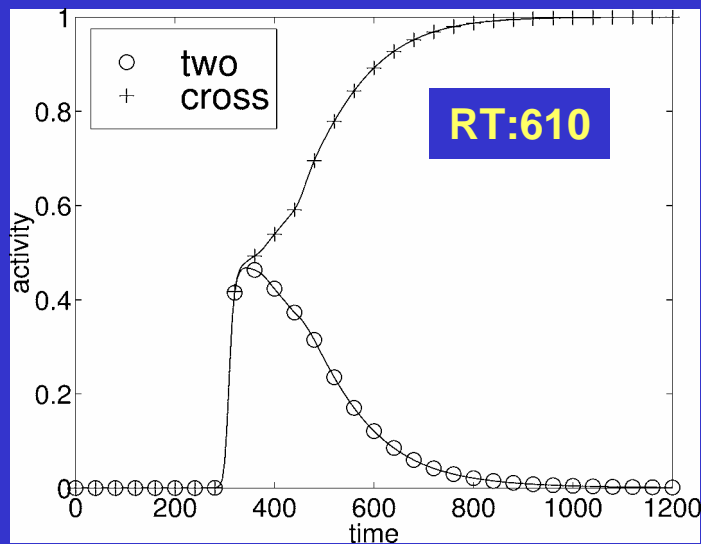

Stimulus

Heinke & Humphreys Psych. Review, 2003

- 2-object costs
- Effects of familiarity on selection
- Spatial cueing
- Inhibition of return
- Object-based effects

Heinke & Humphreys Psych. Review, 2003

- **Spatial extinction**
- **View-centred neglect**
- **Object-centred neglect**

Visual Neglect

Psych. Review: Summary (1)

- **SAIM: No “attentional” module**
- **Normal attention**
 - Multiple object cost
- **Disordered attention**
 - Imbalanced selection process in translation-invariant co-ordinates
 - Influence of object knowledge

Visual Search

- Is there a L?

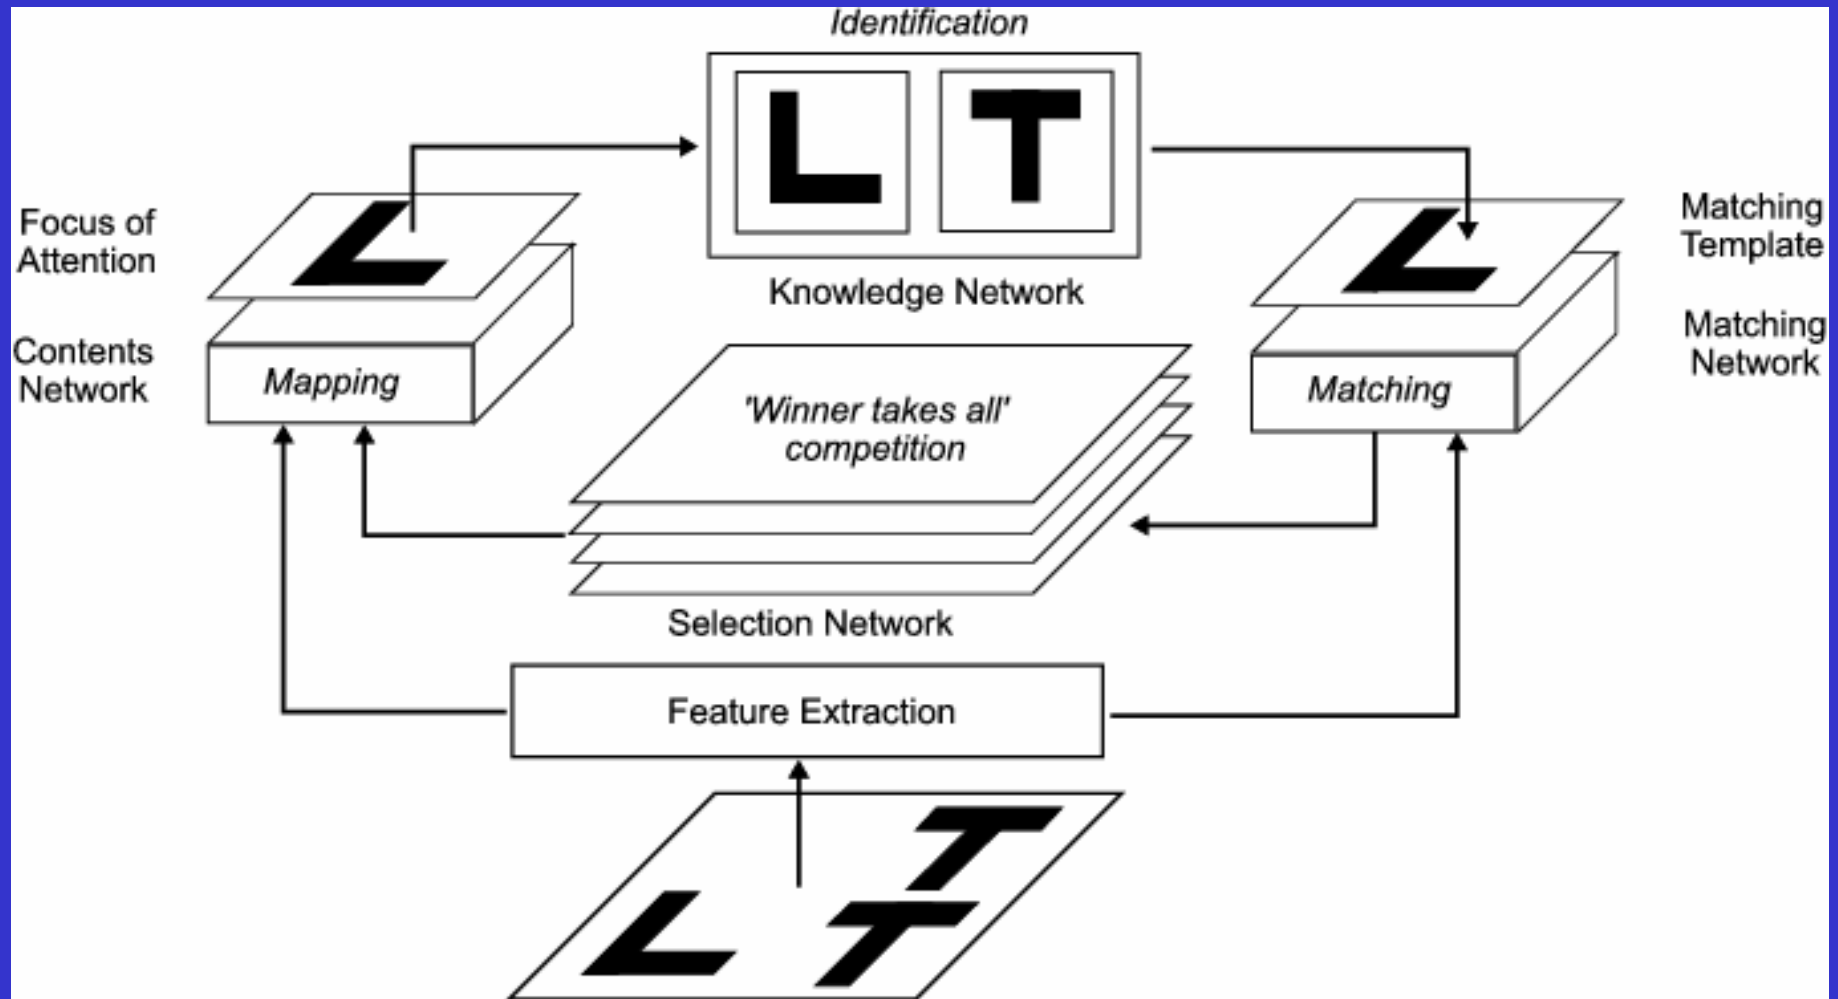

Visual Search

- Is there a horizontal line?

SAIM

Modifications

- **Knowledge Network**
 - Euclidian distance

- **Selection Network**
 - Speed of selection depends on contrast produced in Matching Network

Feature extraction

- HSV Colour space
- Gabor filter: 0° 45° 90° 135°

Matching Network

- **Linear combination of templates from Knowledge Network**
- **Feature Extraction**
- **Euclidian distance**
- **Sliding window**
- **Output feeds into Selection Network**

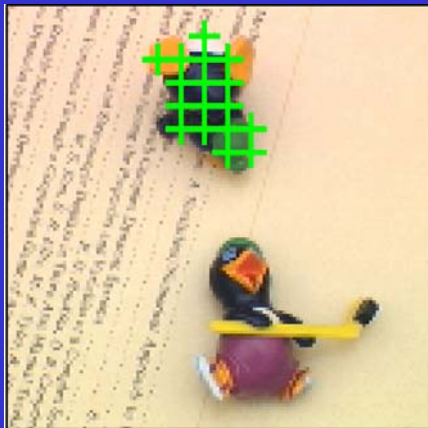

Natural images

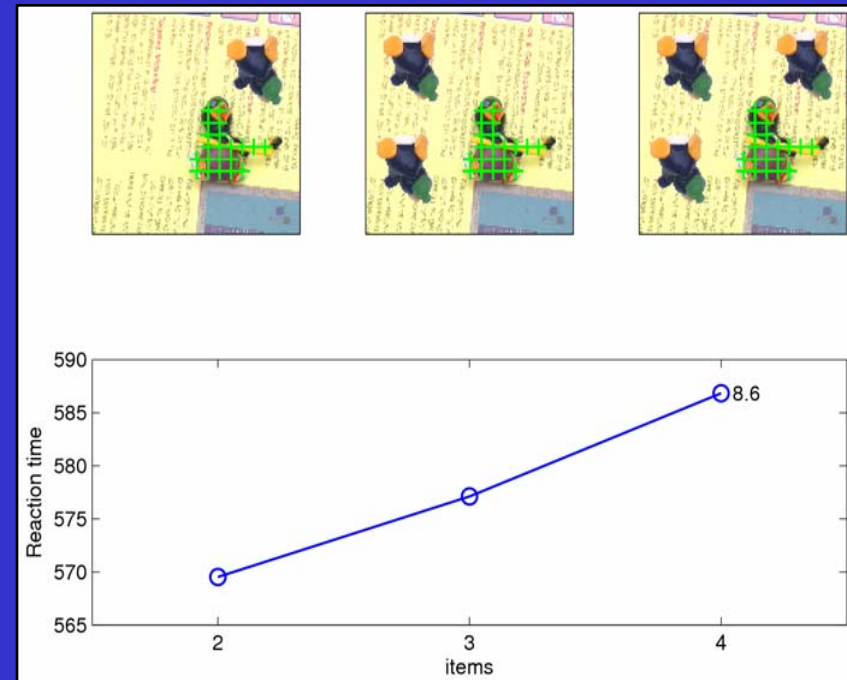

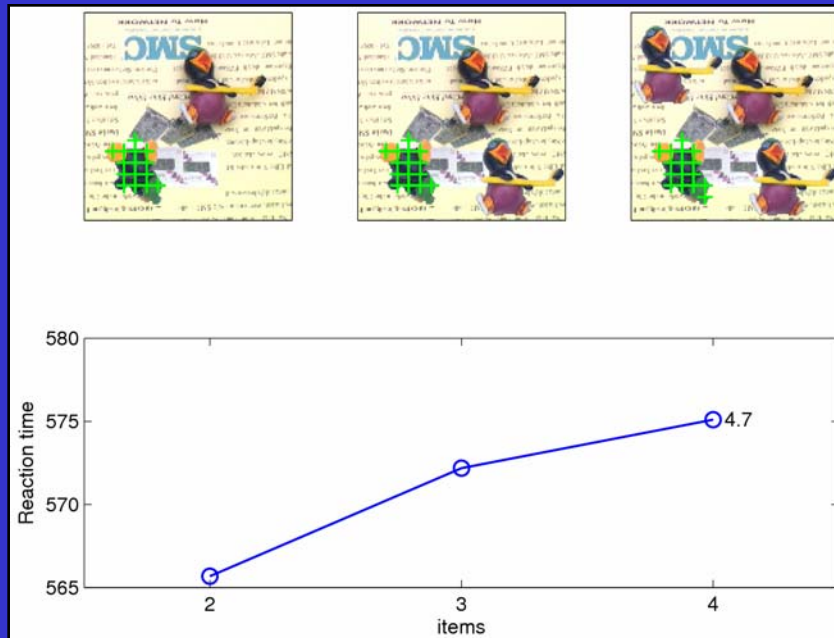

Templates

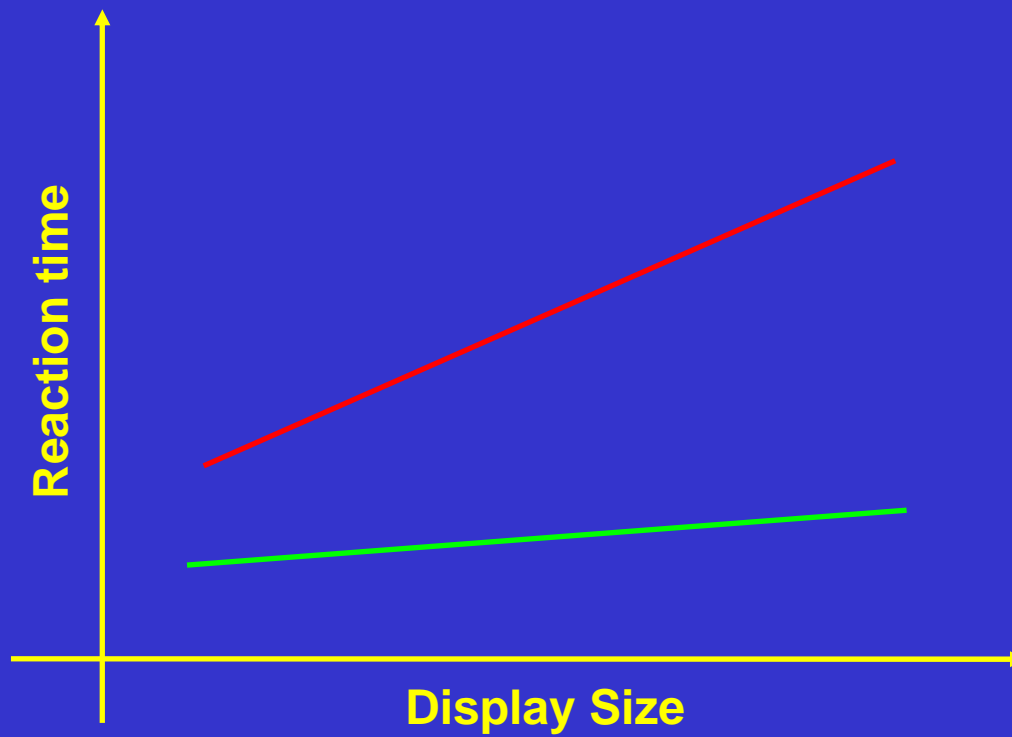

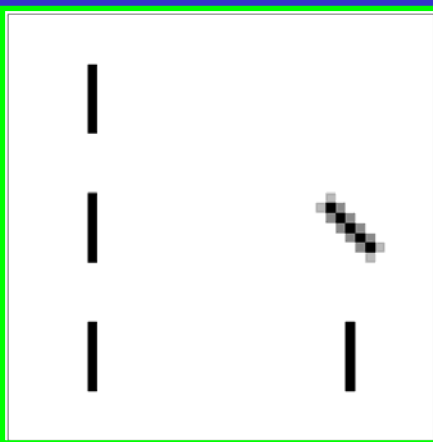

Results

Visual search in natural images

Asymmetry

Simulation method

- **Templates = items**
- **Cuing of target template**
- **Display size: 2, 3, 4, 5, 6, 7, 8**
- **Trials: 5**
- **Present/absent**
- **Decision by passing threshold**

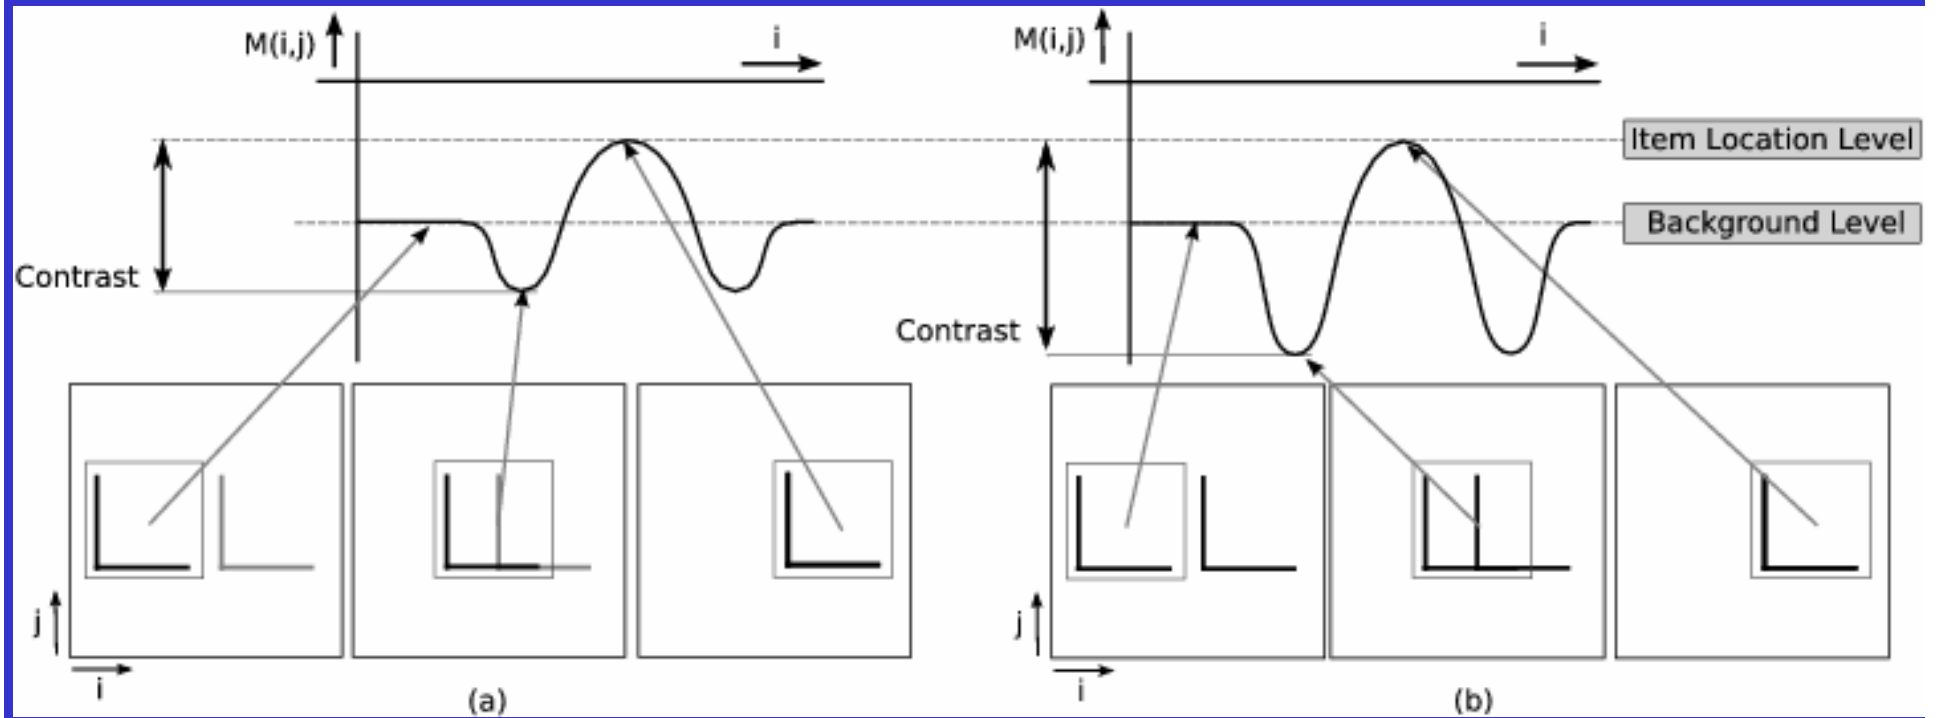

Simulation results: 45-Line-orientation

Parameter analyse

On-centre off-surround

Maximal feature activation

Reasons for line asymmetry

- **Horizontal/Vertical features > diagonal features**
 - Physiological evidence (e.g. Kennedy & Orban, 1979)
 - Psychophysical result (Carrasco et al.)
- **Properties of distractors important factor in search**
 - Rauschenberger & Yantis (2006)
- **On-centre off-surround “matching” field**
 - ??

Lessons

- **Attractor maintained**
- **Relationship between neurophysiological level and human behaviour**

Summary

- **SAIM**
- **Attention as emergent property of competition**
- **Explanation of neuropsychological findings**
- **Search in natural scenes**
- **Explanation of search asymmetry**
- **Spiking version**
